The Reno MSA leading economic index uses a robust econometric approach to determine variables to include in the index and a composite methodology introduced by the Bureau of Economic Analysis of the U.S. Department of Commerce to estimate weights for the selected series. The Reno MSA coincident index is created using the composite methodology introduced by the Department of Commerce and made popular by The Conference Board. All data series are monthly, many are seasonally adjusted using the moving average method, and all series reported in dollar terms are adjusted for inflation. All indexes are based on data starting January 1995, with 1995=100. The following variables are included in each index:

Leading Index

- NV Claims for Unemployment
- WC Gaming Revenue
- WC Single-Family Home Sales
- S&P 500 Index (US)
- WC Taxable Sales
- Interest Rate Spread
- MSA Gasoline Sales
- Money Supply (US)
- RTIA Passengers

Coincident Index

- MSA Nonfarm Employment (CES)
- MSA Household Employment (LAUS)

* MSA-Reno Metropolitan Statistical Area * NV-Nevada * WC-Washoe County * RTIA-Reno Tahoe International Airport

Initial claims for unemployment and interest rate spread series are inversely related to economic growth. An increase in the number of new claims for unemployment would indicate a decline in the economy. Similarly, increases in interest rates slow economic growth as access to capital becomes more expensive.

Reno MSA Leading Index

Reno MSA Leading Index increased between August and September 2018, the fifth month of growth following a two-month decline in March and April.

Reno MSA Leading Economic Index (RLI) predicts future changes in the region’s economy by “leading” current economic activity, represented by the coincident index. The Leading Index is based on ten local, regional, and national data series aggregated using a combination of composite and econometric techniques. Due to lags in data availability, taxable sales and gasoline gallons sold data are projected for the month ahead and updated when actual data becomes available.

The RLI shows a 0.09% increase between August and September 2018. The index increased by 1.20% over the same period last year (September 2017 to 2018). The index experienced small declines in March and April of 2018 and grew since.

Reno MSA Coincident Index

Reno MSA Coincident Index increased between August and September 2018, as the regional economy continues to expand.

The Reno MSA Coincident Index, which reflects current economic conditions in the region, is based on two indicators: Washoe and Storey County employment from the Current Employment Statistics (CES) series and Local Area Unemployment Statistics (LAUS) series.¹ Both series are administered by the Bureau of Labor Statistics (BLS).

The index shows a 0.57% increase between August and September 2018, the highest monthly percentage increase in the index since the recession. The index increased by 5.21% between September 2017 and 2018. The Reno MSA coincident index has increased for 86 straight months since

Series	Latest Period- September 2018	Prev. Period- August 2018	Change Prev. Period	Prev. Year- September 2017	Change Prev. Year

¹ The CES series is based on the establishment-level data, estimates jobs by place of work, and does not include agricultural or self-employed workers. The LAUS series is based on household-level data, estimates employed persons by place of residence, and includes agricultural and self-employed workers. A combination of the two series provides a more accurate picture of the employment situation in the region.
